16. OTHER INFORMATION

Additional information	<p>ALUMINO SILICATES: When alumino silicates have been exposed to service temperatures exceeding 982°C for prolonged periods, cristobalite, a form of crystalline silica may be formed. Exposure to cristobalite dust may cause pulmonary fibrosis-silicosis. A hazard is only anticipated during demolition of used refractory materials. Cristobalite is classified as carcinogenic to humans (IARC Group 1).</p> <p>REFRACTORY BRICKS: These bricks are used for use in high temperature applications. They are typically composed of alumino silicate complexes. They may only present a hazard if cut, drilled, sanded or abraded, thereby generating dust. After use at high temperatures the surfaces will contain high percentages of free silica. Precautions should be taken during maintenance, brick replacement or demolition to avoid dust exposure. Do not stack > 3 high on pallets. Store under plastic - they must be dry before application.</p> <p>PERSONAL PROTECTIVE EQUIPMENT GUIDELINES: The recommendation for protective equipment contained within this report is provided as a guide only. Factors such as method of application, working environment, quantity used, product concentration and the availability of engineering controls should be considered before final selection of personal protective equipment is made.</p> <p>HEALTH EFFECTS FROM EXPOSURE: It should be noted that the effects from exposure to this product will depend on several factors including: frequency and duration of use; quantity used; effectiveness of control measures; protective equipment used and method of application. Given that it is impractical to prepare a ChemAlert report which would encompass all possible scenarios, it is anticipated that users will assess the risks and apply control methods where appropriate.</p>
